**Your Trusted Certified Mohel.**

Providing a warm and caring bris by a  
licensed MD **for a precision circumcision.**

## NEWBORN CIRCUMCISION CARE INSTRUCTIONS

### 1. **Change Diapers Frequently:**

- Change dirty diapers often to keep the area clean and dry.
- Avoid using baby wipes on the circumcision site until it has healed
- Gently clean the circumcision site with warm water if it gets dirtied with stool.
- Gently pat the area dry if needed with a clean gauze or soft towel;  
do not rub.

### 2. **Apply Petroleum Jelly:**

- Apply petroleum jelly (such as Vaseline) liberally to cover the head of the penis to prevent the diaper from sticking.
- Do this with each diaper change.

### 3. **Monitor Healing:**

- On the first day the area will look somewhat red and swollen.
- A small amount of bleeding is possible, but it should not be continuous or excessive.
- Small areas of yellowish healing tissue are likely to form over the circumcision site over the next few days; this is normal and part of the healing process. Do not rub off.
- The circumcision site should heal within 7 to 10 days.

### 4. **Watch for Signs of Infection:**

- Look for redness, swelling, or any discharge that is yellow or green.
- If you notice any of these signs, or have any questions or concerns, contact me or your pediatrician for guidance.
